

TincTract Dosing

Welcome to the New Era in Herbal Medicine!

Pure Health TincTract®s are finally here!

Are you still using herbal extracts utilizing the out dated extraction processes based on the work of eclectic practitioners from the late 1800's? Although these processes were ground breaking at the time, the limitations induced by alcohol extraction have never been overcome but the knowledge of how to effectively use glycerin has led to a new dimension of herbal medicine that previously could not be matched.

Experience the Power of Nature's Raw Synergy

Alcohol not only denatures, renders inert and/or destroys many vitamins in herbs, it has been documented to destroy many nutrients in the digestive tract as well.

Even though alcohol may be a great sterilizing agent (due to its disinfecting and dissociating nature) it renders useless so many constituents and nutrients that a pure ethyl grain alcohol-based product is actually very limited in its potential and therapeutic benefits, especially those nutritionally related, when compared to the broad benefits contained in a TincTract® brand processed liquid herbal glycerite. This is not to say that an alcohol prepared herbal product doesn't have its place. It's just that it is becoming more evident to those who use both types of preparations that a fair evaluation supports the premise that TincTract® brand glycerites are more versatile in their applications. In fact, over time as most health practitioners, herbalists and consumers use TincTract® brand 'true' alcohol-free products they seldom use any other liquid preparation thereafter, especially alcohol prepared ones, so impressed are they with the versatility and efficacy of TincTract® brand glycerites.

The bottom line is that the status of grain alcohol being the 'preferred' extractive medium for herbs is not only outdated but no longer supported in either a scientific or intrinsic sense. For most of a century a premise, that was outdated within 20 years of its introduction, has been dogmatically held to while the facts show differently. Truth is, though more expensive, Glycerin is more versatile, safer and beneficial than alcohol is intrinsically capable of ever being.

A New Paradigm in Dosing!

Herb/Fluid ratio numbers, as they are popularly used, are meaningless as far as any perceived and/or assumed market or science-based quality standard is concerned. No 'numbers game' here... either the products work or they don't. It's called an '*Efficacy Standard*,' and it's the only factor that best defines what 'Ratio-Intact' Synergy Sparing is, meaning that the naturally occurring ratios between the various components of an herb are retained. 'Effectiveness' is the most important defining factor that determines the 'real' quality of an herbal product. It's what '*Genuine TincTract® Made*' is all about.

How to Dose a Pure Health TincTract®?

Due to the synergistic efficacy of Pure Health TincTract®s, blends as well as singular herbs are dosed at the same rate (as below). When making a blend, simply calculate the amount of each herb based on their individual importance to your patient. It's so simple!

SINGLE & BLEND DOSING

Use	Amount mL	Amount teaspoon
Maintenance	0.62mL	1/8 teaspoon (1-3times daily)
Min Therapeutic	1.2mL	1/4 teaspoon (1-3times daily)
Max Therapeutic	2.4mL	1/2 teaspoon (1-3times daily)
